

WidgetNet: A Sample Paper for Citation Checking

Abstract

WidgetNet counts widgets in laboratory images.

1 Introduction

The main contribution is a counter called WidgetNet.

Previous work counts widgets by hand.

2 Method

WidgetNet uses a two-stage counter.

The first stage proposes regions.

The second stage labels each region as a widget.

2.1 Training

Training uses the Widget-100 dataset for 12 epochs.

3 Experiments

On Widget-100, WidgetNet reaches 91 percent accuracy.

The strongest baseline reaches 80 percent accuracy.

The efficiency experiment shows that WidgetNet uses 30 percent less memory than the baseline.

4 Conclusion

WidgetNet improves widget counting accuracy over hand counting.
